

# CROSSINGS

A variety of crossings are designed to accommodate most any situation along with the ability to build double crossovers using #6 or #8 turnouts.

Crossings come in 14, 19, 30, 45, 60, and 90 degrees and are available weathered or unweathered. As with our turnouts, these crossings are available in all three rail code sizes, 70, 83, and 100.

Examples of 90, 30 and 19 degree crossings

If constructing a double crossover with #6 turnouts, use the 19 degree crossing. If using #8 turnouts then the 14 degree crossing should be used.
